Problem Description

There are no good simple polling websites where users can create and participate in polls quickly without all the other faff.

Other applications such as social media sites and sites for voting on meeting times exist, but this leaves a gap for a dedicated stand-alone polling website for entertainment. Such a website would allow users can get unbiased opinions on topics in an entertaining way.

Problem Solution

I have created a 'Real Poles' website for the general public of Poland to conduct polls.

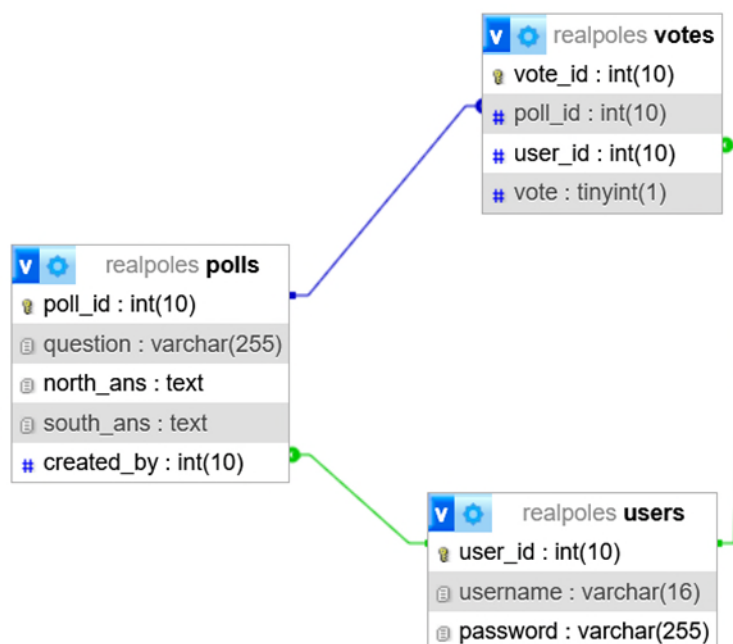

Humans are inherently curious and like to know other people's opinions on unusual topics and with our ever-decreasing attention span a simple scrolling website where you can poll and create polls is needed. My website will facilitate this itch allowing registered users to create and vote in polls, while unregistered users can only view (and not vote) on exiting polls.

Database Schema

Users: Stores user data (id, username, password, email)

Polls: Stores polls data (id, question, north_ans, south_ans, created_by)

Votes: Stores votes (vote_id, poll_id, user_id, vote (1 or 0)).
